

Electrified freight – Exploring Resource Sharing

The Goal of the Project: Provide a better understanding of the role of resources and how actors working collaborative can be an enabler for the transition to electrified freight transportation.

This will be achieved by identifying relevant resources in three different actor interfaces and exploring how these resources can be shared to facilitate the transition.

Expected Result: An explanatory model mapping important resources in different actor interfaces, along with a description of how these resources can be efficiently and effectively shared.

One peer-reviewed journal article submitted to an esteemed logistics/transport journal.

Two conference papers presented at international conferences.
